Paper Title: Platform for Testing Grid Support Services of Grid-Forming Hybrid PV Power Plants

Josue Andino is a predoctoral researcher at IMDEA Energy and Ph.D. student at the University of Alcalá, focusing on the analysis and damping of interactions in converter-based power networks—critical for the stability of modern electric grids. He holds a Master’s degree in Electronics Research with a specialization in Automatic Control and brings extensive experience in power electronics, control systems, and renewable energy integration. His current project, DYNAMIC-COMPENSATION, develops advanced control algorithms for reactive power compensation.
